

Skiomod V126

By: Logg, gamer78432698

REQUIREMENTS

Chromebook with Chrome
V126

Speed/luck (imagine being
slow)

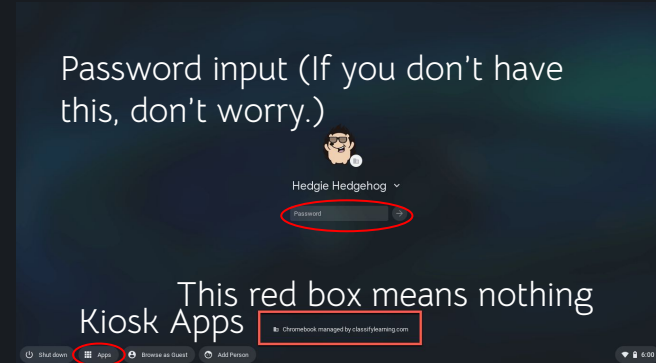

Auto-connecting wifi

A brain

First Steps

Log out of your device. Remember to save progress if you aren't retarded. Turn off wifi, and put in your password (DO NOT CLICK ENTER). Now open up the kiosk apps thing.

These next steps require that speed, so make sure you drank 55 Monsters!

QUICKLY DO THIS NOW NOW NOW! ○

Go into your Kiosk App of choice (TestNav works), and wait with your cursor near the top right of the screen, and immediately click “Add Network”. Make a quick, 1-letter name, and press enter. Click “Diagnose” in the bottom right, open the first wifi tab, and double click the blue settings hyperlink. Close the window that just opened, (diagnostics), and press “Ctrl+Alt+Shift+R”. Click “Cancel”, and quickly log in.

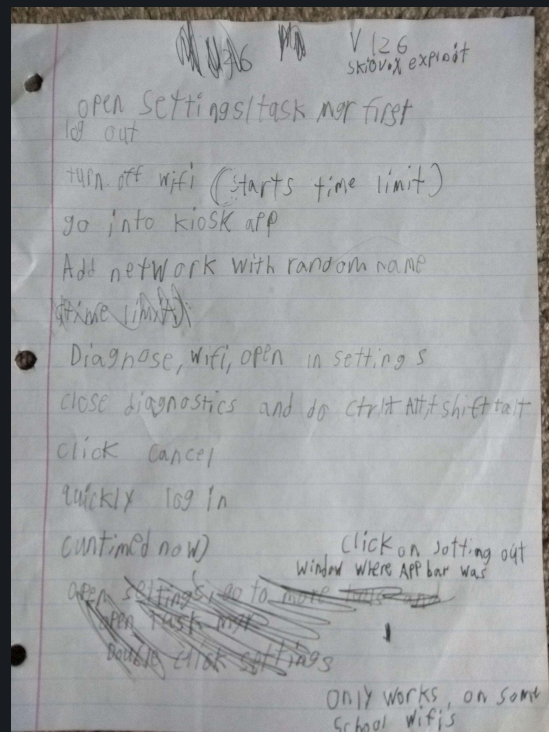

If You Did It Right...

If you did it right, you should have no taskbar, wifi on, and 2 windows. If you don't see 2 windows, exit your main chrome window, and you should see a blank chrome window. (Incognito-like). This window is completely free, and can do anything!

If it didn't work, try again a couple of times, and if that still didn't work, cry in a corner.
